- Logarithmic differentiation.

Definition as an integral

Recall:

(a) The derivative of $y = x^n$ is

Definition as an integral

Recall:

(a) The derivative of $y = x^n$ is $y' = n\,x^{(n-1)}$, for n integer.

Definition as an integral

Recall:

(a) The derivative of $y = x^n$ is $y' = n\,x^{(n-1)}$, for n integer.

(b) The integral of $y = x^n$ is

Definition as an integral

Recall:

(a) The derivative of $y = x^n$ is $y' = n\,x^{(n-1)}$, for n integer.

(b) The integral of $y = x^n$ is $\displaystyle\int x^n\,dx = \frac{x^{(n+1)}}{(n+1)}$,

Definition as an integral

Recall:

(a) The derivative of $y = x^n$ is $y' = n\,x^{(n-1)}$, for n integer.

(b) The integral of $y = x^n$ is $\int x^n\,dx = \frac{x^{(n+1)}}{(n+1)}$, for $n \neq -1$.

Definition as an integral

Recall:

(a) The derivative of $y = x^n$ is $y' = n\,x^{(n-1)}$, for n integer.

(b) The integral of $y = x^n$ is $\int x^n\,dx = \frac{x^{(n+1)}}{(n+1)}$, for $n \neq -1$.

(c) Case $n = -1$: $\int \frac{dx}{x}$

Definition as an integral

Recall:

(a) The derivative of $y = x^n$ is $y' = n\,x^{(n-1)}$, for n integer.

(b) The integral of $y = x^n$ is $\int x^n\,dx = \dfrac{x^{(n+1)}}{(n+1)}$, for $n \neq -1$.

(c) Case $n = -1$: $\int \dfrac{dx}{x}$ is neither rational nor trigonometric function.

Definition as an integral

Recall:

(a) The derivative of $y = x^n$ is $y' = n\,x^{(n-1)}$, for n integer.

(b) The integral of $y = x^n$ is $\displaystyle\int x^n\,dx = \frac{x^{(n+1)}}{(n+1)}$, for $n \neq -1$.

(c) Case $n = -1$: $\displaystyle\int \frac{dx}{x}$ is neither rational nor trigonometric function. This is a new function.

Definition as an integral

Recall:

(a) The derivative of $y = x^n$ is $y' = n\,x^{(n-1)}$, for n integer.

(b) The integral of $y = x^n$ is $\displaystyle\int x^n\,dx = \frac{x^{(n+1)}}{(n+1)}$, for $n \neq -1$.

(c) Case $n = -1$: $\displaystyle\int \frac{dx}{x}$ is neither rational nor trigonometric function. This is a new function.

Definition

The *natural logarithm* is the function

$$\ln(x) = \int_1^x \frac{dt}{t}, \qquad x \in (0, \infty).$$

Definition as an integral

Recall:

(a) The derivative of $y = x^n$ is $y' = n\,x^{(n-1)}$, for n integer.

(b) The integral of $y = x^n$ is $\int x^n\,dx = \dfrac{x^{(n+1)}}{(n+1)}$, for $n \neq -1$.

(c) Case $n = -1$: $\int \dfrac{dx}{x}$ is neither rational nor trigonometric function. This is a new function.

Definition

The *natural logarithm* is the function

$$\ln(x) = \int_1^x \frac{dt}{t}, \qquad x \in (0, \infty).$$

In particular: $\ln(1) = 0$.

Definition as an integral

Recall:

(a) The derivative of $y = x^n$ is $y' = n\,x^{(n-1)}$, for n integer.

(b) The integral of $y = x^n$ is $\displaystyle\int x^n\,dx = \frac{x^{(n+1)}}{(n+1)}$, for $n \neq -1$.

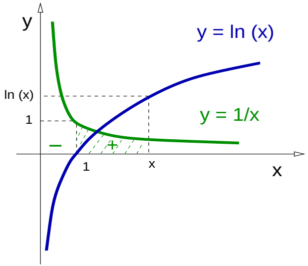
(c) Case $n = -1$: $\displaystyle\int \frac{dx}{x}$ is neither rational nor trigonometric function. This is a new function.

Definition

The *natural logarithm* is the function

$$\ln(x) = \int_1^x \frac{dt}{t}, \qquad x \in (0, \infty).$$

In particular: $\ln(1) = 0$.



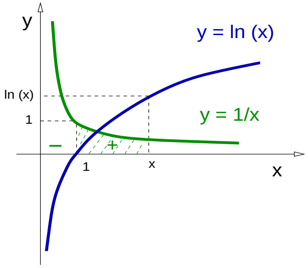
Definition as an integral

Definition

The *natural logarithm* is the function

$$\ln(x) = \int_1^x \frac{dt}{t}, \qquad x \in (0, \infty).$$

In particular: $\ln(1) = 0$.



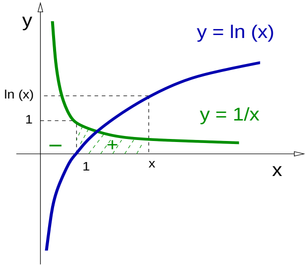
Definition as an integral

Definition

The *natural logarithm* is the function

$$\ln(x) = \int_1^x \frac{dt}{t}, \qquad x \in (0, \infty).$$

In particular: $\ln(1) = 0$.



Definition

The *number e* is the number satisfying $\ln(e) = 1$,

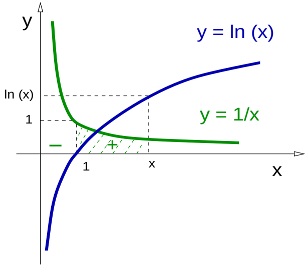
Definition as an integral

Definition

The *natural logarithm* is the function

$$\ln(x) = \int_1^x \frac{dt}{t}, \qquad x \in (0, \infty).$$

In particular: $\ln(1) = 0$.



Definition

The *number e* is the number satisfying $\ln(e) = 1$, that is,

$$\int_1^e \frac{dt}{t} = 1.$$

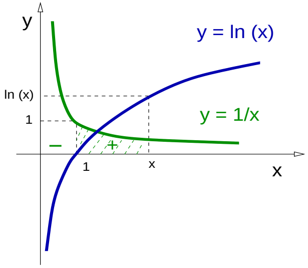
Definition as an integral

Definition

The *natural logarithm* is the function

$$\ln(x) = \int_1^x \frac{dt}{t}, \qquad x \in (0, \infty).$$

In particular: $\ln(1) = 0$.



Definition

The *number e* is the number satisfying $\ln(e) = 1$, that is,

$$\int_1^e \frac{dt}{t} = 1.$$

$(e = 2.718281...)$.

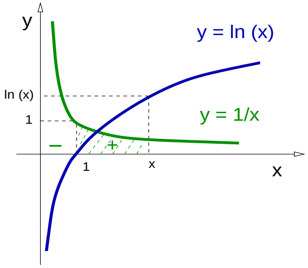
Definition as an integral

Definition

The *natural logarithm* is the function

$$\ln(x) = \int_1^x \frac{dt}{t}, \qquad x \in (0, \infty).$$

In particular: $\ln(1) = 0$.

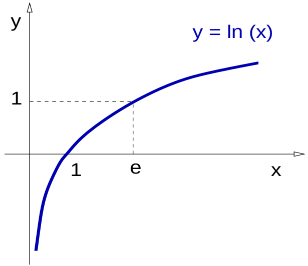


Definition

The *number e* is the number satisfying $\ln(e) = 1$, that is,

$$\int_1^e \frac{dt}{t} = 1.$$

($e = 2.718281...$).



Natural Logarithms (Sect. 7.2)

- Logarithmic differentiation.

The derivative and properties

Theorem (Derivative of ln)

The Fundamental Theorem of Calculus implies $\ln'(x) = \dfrac{1}{x}$.

The derivative and properties

Theorem (Derivative of ln)

The Fundamental Theorem of Calculus implies $\ln'(x) = \dfrac{1}{x}$.

Proof:

$$\ln(x) = \int_1^x \frac{dt}{t}$$

The derivative and properties

Theorem (Derivative of ln)

The Fundamental Theorem of Calculus implies $\ln'(x) = \dfrac{1}{x}$.

Proof:

$$\ln(x) = \int_1^x \frac{dt}{t} \quad \Rightarrow \quad \ln'(x) = \frac{1}{x}.$$

$\square$

The derivative and properties

Theorem (Derivative of ln)

The Fundamental Theorem of Calculus implies $\ln'(x) = \dfrac{1}{x}$.

Proof:

$$\ln(x) = \int_1^x \frac{dt}{t} \quad \Rightarrow \quad \ln'(x) = \frac{1}{x}.$$

□

Theorem (Chain rule)

For every differentiable function u holds $\big[\ln(u)\big]' = \dfrac{u'}{u}$.

The derivative and properties

Theorem (Derivative of ln)

The Fundamental Theorem of Calculus implies $\ln'(x) = \dfrac{1}{x}$.

Proof:

$$\ln(x) = \int_1^x \frac{dt}{t} \quad \Rightarrow \quad \ln'(x) = \frac{1}{x}.$$

$\square$

Theorem (Chain rule)

For every differentiable function u holds $\big[\ln(u)\big]' = \dfrac{u'}{u}$.

Proof:

$$\frac{d\ln(u)}{dx} =$$

The derivative and properties

Theorem (Derivative of ln)

The Fundamental Theorem of Calculus implies $\ln'(x) = \dfrac{1}{x}$.

Proof:

$$\ln(x) = \int_1^x \frac{dt}{t} \quad \Rightarrow \quad \ln'(x) = \frac{1}{x}.$$

□

Theorem (Chain rule)

For every differentiable function u holds $\big[\ln(u)\big]' = \dfrac{u'}{u}$.

Proof:

$$\frac{d\ln(u)}{dx} = \frac{d\ln}{du}(u)\,\frac{du}{dx}$$

The derivative and properties

Theorem (Derivative of ln)

The Fundamental Theorem of Calculus implies $\ln'(x) = \dfrac{1}{x}$.

Proof:

$$\ln(x) = \int_1^x \frac{dt}{t} \quad \Rightarrow \quad \ln'(x) = \frac{1}{x}.$$

$\square$

Theorem (Chain rule)

For every differentiable function u holds $\big[\ln(u)\big]' = \dfrac{u'}{u}$.

Proof:

$$\frac{d\ln(u)}{dx} = \frac{d\ln}{du}(u)\,\frac{du}{dx} = \frac{1}{u}\,u'$$

The derivative and properties

Theorem (Derivative of ln)

The Fundamental Theorem of Calculus implies $\ln'(x) = \dfrac{1}{x}$.

Proof:

$$\ln(x) = \int_1^x \frac{dt}{t} \quad \Rightarrow \quad \ln'(x) = \frac{1}{x}.$$

$\square$

Theorem (Chain rule)

For every differentiable function u holds $\big[\ln(u)\big]' = \dfrac{u'}{u}$.

Proof:

$$\frac{d\ln(u)}{dx} = \frac{d\ln}{du}(u)\,\frac{du}{dx} = \frac{1}{u}\,u' \quad \Rightarrow \quad \frac{d\ln(u)}{dx}(x) = \frac{u'(x)}{u(x)}.$$

$\square$

The derivative and properties

Example

Find the derivative of $y(x) = \ln(3x)$, and $z(x) = \ln\big(2x^2 + \cos(x)\big)$.

The derivative and properties

Example

Find the derivative of $y(x) = \ln(3x)$, and $z(x) = \ln\big(2x^2 + \cos(x)\big)$.

Solution: We use the chain rule.

$$y'(x) = \frac{1}{(3x)}\,(3)$$

The derivative and properties

Example

Find the derivative of $y(x) = \ln(3x)$, and $z(x) = \ln\big(2x^2 + \cos(x)\big)$.

Solution: We use the chain rule.

$$y'(x) = \frac{1}{(3x)}(3) = \frac{1}{x}$$

The derivative and properties

Example

Find the derivative of $y(x) = \ln(3x)$, and $z(x) = \ln\big(2x^2 + \cos(x)\big)$.

Solution: We use the chain rule.

$$y'(x) = \frac{1}{(3x)}\,(3) = \frac{1}{x} \quad \Rightarrow \quad y'(x) = \frac{1}{x}.$$

The derivative and properties

Example

Find the derivative of $y(x) = \ln(3x)$, and $z(x) = \ln\big(2x^2 + \cos(x)\big)$.

Solution: We use the chain rule.

$$y'(x) = \frac{1}{(3x)}\,(3) = \frac{1}{x} \quad \Rightarrow \quad y'(x) = \frac{1}{x}.$$

We also use chain rule,

$$z'(x) = \frac{1}{\big(2x^2 + \cos(x)\big)}\,(4x - \sin(x))$$

The derivative and properties

Example

Find the derivative of $y(x) = \ln(3x)$, and $z(x) = \ln\big(2x^2 + \cos(x)\big)$.

Solution: We use the chain rule.

$$y'(x) = \frac{1}{(3x)}\,(3) = \frac{1}{x} \quad \Rightarrow \quad y'(x) = \frac{1}{x}.$$

We also use chain rule,

$$z'(x) = \frac{1}{\big(2x^2 + \cos(x)\big)}\,(4x - \sin(x))$$

$$z'(x) = \frac{4x - \sin(x)}{2x^2 + \cos(x)}.$$

$\triangleleft$

The derivative and properties

Example

Find the derivative of $y(x) = \ln(3x)$, and $z(x) = \ln\big(2x^2 + \cos(x)\big)$.

Solution: We use the chain rule.

$$y'(x) = \frac{1}{(3x)}\,(3) = \frac{1}{x} \quad \Rightarrow \quad y'(x) = \frac{1}{x}.$$

We also use chain rule,

$$z'(x) = \frac{1}{\big(2x^2 + \cos(x)\big)}\,(4x - \sin(x))$$

$$z'(x) = \frac{4x - \sin(x)}{2x^2 + \cos(x)}.$$

$\triangleleft$

Remark: $y(x) = \ln(3x)$, satisfies $y'(x) = \ln'(x)$.

The derivative and properties

Theorem (Algebraic properties)

For every positive real numbers a and b holds,

(a) $\ln(ab) = \ln(a) + \ln(b)$, (product rule);

(b) $\ln\left(\dfrac{a}{b}\right) = \ln(a) - \ln(b)$, (quotient rule);

(c) $\ln\left(\dfrac{1}{a}\right) = -\ln(a)$, (reciprocal rule);

(d) $\ln(a^b) = b\ln(a)$, (power rule).

The derivative and properties

Theorem (Algebraic properties)

For every positive real numbers a and b holds,

(a) $\ln(ab) = \ln(a) + \ln(b)$, (product rule);

(b) $\ln\left(\frac{a}{b}\right) = \ln(a) - \ln(b)$, (quotient rule);

(c) $\ln\left(\frac{1}{a}\right) = -\ln(a)$, (reciprocal rule);

(d) $\ln(a^b) = b\ln(a)$, (power rule).

Proof of (a): (only)

The derivative and properties

Theorem (Algebraic properties)

For every positive real numbers a and b holds,

(a) $\ln(ab) = \ln(a) + \ln(b)$, (product rule);

(b) $\ln\left(\dfrac{a}{b}\right) = \ln(a) - \ln(b)$, (quotient rule);

(c) $\ln\left(\dfrac{1}{a}\right) = -\ln(a)$, (reciprocal rule);

(d) $\ln(a^b) = b\ln(a)$, (power rule).

Proof of (a): (only)

The function $y(x) = \ln(ax)$ satisfies $y'(x) = \dfrac{1}{ax}\, a$

The derivative and properties

Theorem (Algebraic properties)

For every positive real numbers a and b holds,

(a) $\ln(ab) = \ln(a) + \ln(b)$, (product rule);

(b) $\ln\left(\dfrac{a}{b}\right) = \ln(a) - \ln(b)$, (quotient rule);

(c) $\ln\left(\dfrac{1}{a}\right) = -\ln(a)$, (reciprocal rule);

(d) $\ln(a^b) = b\ln(a)$, (power rule).

Proof of (a): (only)

The function $y(x) = \ln(ax)$ satisfies $y'(x) = \dfrac{1}{ax}\,a = \dfrac{1}{x}$

The derivative and properties

Theorem (Algebraic properties)

For every positive real numbers a and b holds,

(a) $\ln(ab) = \ln(a) + \ln(b)$, (product rule);

(b) $\ln\left(\dfrac{a}{b}\right) = \ln(a) - \ln(b)$, (quotient rule);

(c) $\ln\left(\dfrac{1}{a}\right) = -\ln(a)$, (reciprocal rule);

(d) $\ln(a^b) = b\ln(a)$, (power rule).

Proof of (a): (only)

The function $y(x) = \ln(ax)$ satisfies $y'(x) = \dfrac{1}{ax}\,a = \dfrac{1}{x} = \ln'(x)$

The derivative and properties

Theorem (Algebraic properties)

For every positive real numbers a and b holds,

(a) $\ln(ab) = \ln(a) + \ln(b)$, (product rule);

(b) $\ln\left(\dfrac{a}{b}\right) = \ln(a) - \ln(b)$, (quotient rule);

(c) $\ln\left(\dfrac{1}{a}\right) = -\ln(a)$, (reciprocal rule);

(d) $\ln(a^b) = b\ln(a)$, (power rule).

Proof of (a): (only)

The function $y(x) = \ln(ax)$ satisfies $y'(x) = \dfrac{1}{ax}\,a = \dfrac{1}{x} = \ln'(x)$

Therefore $\ln(ax) = \ln(x) + c$.

The derivative and properties

Theorem (Algebraic properties)

For every positive real numbers a and b holds,

(a) $\ln(ab) = \ln(a) + \ln(b)$, (product rule);

(b) $\ln\left(\dfrac{a}{b}\right) = \ln(a) - \ln(b)$, (quotient rule);

(c) $\ln\left(\dfrac{1}{a}\right) = -\ln(a)$, (reciprocal rule);

(d) $\ln(a^b) = b\ln(a)$, (power rule).

Proof of (a): (only)

The function $y(x) = \ln(ax)$ satisfies $y'(x) = \dfrac{1}{ax}\,a = \dfrac{1}{x} = \ln'(x)$

Therefore $\ln(ax) = \ln(x) + c$. Evaluating at $x = 1$ we obtain c.

The derivative and properties

Theorem (Algebraic properties)

For every positive real numbers a and b holds,

(a) $\ln(ab) = \ln(a) + \ln(b)$, (product rule);

(b) $\ln\left(\dfrac{a}{b}\right) = \ln(a) - \ln(b)$, (quotient rule);

(c) $\ln\left(\dfrac{1}{a}\right) = -\ln(a)$, (reciprocal rule);

(d) $\ln(a^b) = b\ln(a)$, (power rule).

Proof of (a): (only)

The function $y(x) = \ln(ax)$ satisfies $y'(x) = \dfrac{1}{ax}\,a = \dfrac{1}{x} = \ln'(x)$

Therefore $\ln(ax) = \ln(x) + c$. Evaluating at $x = 1$ we obtain c.

$$\ln(a) = \ln(1) + c$$

The derivative and properties

Theorem (Algebraic properties)

For every positive real numbers a and b holds,

(a) $\ln(ab) = \ln(a) + \ln(b)$, (product rule);

(b) $\ln\left(\dfrac{a}{b}\right) = \ln(a) - \ln(b)$, (quotient rule);

(c) $\ln\left(\dfrac{1}{a}\right) = -\ln(a)$, (reciprocal rule);

(d) $\ln(a^b) = b\ln(a)$, (power rule).

Proof of (a): (only)

The function $y(x) = \ln(ax)$ satisfies $y'(x) = \dfrac{1}{ax}\,a = \dfrac{1}{x} = \ln'(x)$

Therefore $\ln(ax) = \ln(x) + c$. Evaluating at $x = 1$ we obtain c.

$$\ln(a) = \ln(1) + c \;\Rightarrow\; c = \ln(a)$$

The derivative and properties

Theorem (Algebraic properties)

For every positive real numbers a and b holds,

(a) $\ln(ab) = \ln(a) + \ln(b)$, (product rule);

(b) $\ln\left(\dfrac{a}{b}\right) = \ln(a) - \ln(b)$, (quotient rule);

(c) $\ln\left(\dfrac{1}{a}\right) = -\ln(a)$, (reciprocal rule);

(d) $\ln(a^b) = b\ln(a)$, (power rule).

Proof of (a): (only)

The function $y(x) = \ln(ax)$ satisfies $y'(x) = \dfrac{1}{ax}\, a = \dfrac{1}{x} = \ln'(x)$

Therefore $\ln(ax) = \ln(x) + c$. Evaluating at $x = 1$ we obtain c.

$$\ln(a) = \ln(1) + c \;\Rightarrow\; c = \ln(a) \;\Rightarrow\; \ln(ax) = \ln(x) + \ln(a).$$

The derivative and properties

Example

Compute the derivative of $y(x) = \ln\left[\dfrac{(x+1)^2}{3(x+2)}\right]$.

The derivative and properties

Example

Compute the derivative of $y(x) = \ln\left[\dfrac{(x+1)^2}{3(x+2)}\right]$.

Solution: Before computing the derivative of y, we simplify it,

The derivative and properties

Example

Compute the derivative of $y(x) = \ln\left[\dfrac{(x+1)^2}{3(x+2)}\right]$.

Solution: Before computing the derivative of y, we simplify it,

$$y = \ln\left[(x+1)^2\right] - \ln\left[3(x+2)\right],$$

The derivative and properties

Example

Compute the derivative of $y(x) = \ln\Big[\dfrac{(x+1)^2}{3(x+2)}\Big]$.

Solution: Before computing the derivative of y, we simplify it,

$$y = \ln\big[(x+1)^2\big] - \ln\big[3(x+2)\big],$$

$$y = 2\,\ln(x+1) - \big[\ln(3) + \ln(x+2)\big].$$

The derivative and properties

Example

Compute the derivative of $y(x) = \ln\Big[\dfrac{(x+1)^2}{3(x+2)}\Big]$.

Solution: Before computing the derivative of y, we simplify it,

$$y = \ln\big[(x+1)^2\big] - \ln\big[3(x+2)\big],$$

$$y = 2\,\ln(x+1) - \big[\ln(3) + \ln(x+2)\big].$$

The derivative of function y is: $\;y' = 2\,\dfrac{1}{(x+1)} - \dfrac{1}{(x+2)}$.

The derivative and properties

Example

Compute the derivative of $y(x) = \ln\Big[\frac{(x+1)^2}{3(x+2)}\Big]$.

Solution: Before computing the derivative of y, we simplify it,

$$y = \ln\big[(x+1)^2\big] - \ln\big[3(x+2)\big],$$

$$y = 2\,\ln(x+1) - \big[\ln(3) + \ln(x+2)\big].$$

The derivative of function y is: $\;y' = 2\,\frac{1}{(x+1)} - \frac{1}{(x+2)}$.

$$y' = \frac{2(x+2) - (x+1)}{(x+1)(x+2)}$$

The derivative and properties

Example

Compute the derivative of $y(x) = \ln\Big[\dfrac{(x+1)^2}{3(x+2)}\Big]$.

Solution: Before computing the derivative of y, we simplify it,

$$y = \ln\big[(x+1)^2\big] - \ln\big[3(x+2)\big],$$

$$y = 2\,\ln(x+1) - \big[\ln(3) + \ln(x+2)\big].$$

The derivative of function y is: $\;y' = 2\,\dfrac{1}{(x+1)} - \dfrac{1}{(x+2)}$.

$$y' = \frac{2(x+2) - (x+1)}{(x+1)(x+2)} \quad \Rightarrow \quad y' = \frac{(x+3)}{(x+1)(x+2)}. \qquad \triangleleft$$

Natural Logarithms (Sect. 7.2)

- Definition as an integral.
- The derivative and properties.
- The graph of the natural logarithm.
- Integrals involving logarithms.
- Logarithmic differentiation.

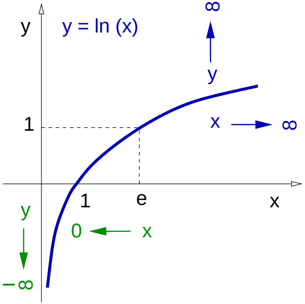
The graph of the natural logarithm

Remarks:

The graph of ln function has:

(a) A vertical asymptote at $x = 0$.

(b) No horizontal asymptote.



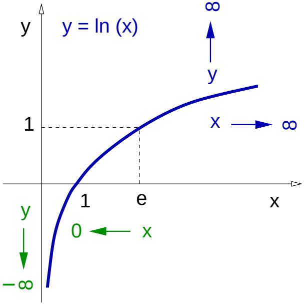
The graph of the natural logarithm

Remarks:

The graph of ln function has:

(a) A vertical asymptote at $x = 0$.

(b) No horizontal asymptote.



Proof: Recall $e = 2.718281... > 1$ and $\ln(e) = 1$.

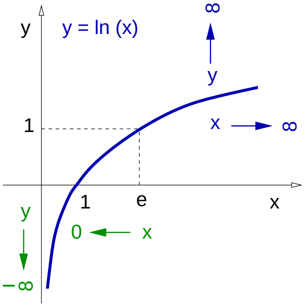
The graph of the natural logarithm

Remarks:

The graph of ln function has:

(a) A vertical asymptote at $x = 0$.

(b) No horizontal asymptote.



Proof: Recall $e = 2.718281... > 1$ and $\ln(e) = 1$.

(a): If $x = e^n$,

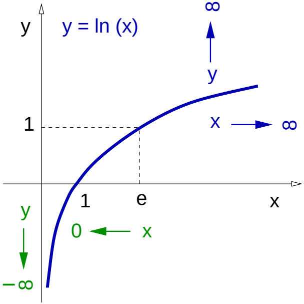
The graph of the natural logarithm

Remarks:

The graph of ln function has:

(a) A vertical asymptote at $x = 0$.

(b) No horizontal asymptote.



Proof: Recall $e = 2.718281... > 1$ and $\ln(e) = 1$.

(a): If $x = e^n$, then $\ln(e^n) = n \ln(e)$

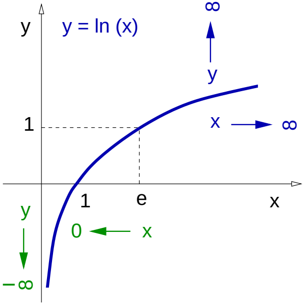
The graph of the natural logarithm

Remarks:

The graph of ln function has:

(a) A vertical asymptote at $x = 0$.

(b) No horizontal asymptote.



Proof: Recall $e = 2.718281... > 1$ and $\ln(e) = 1$.

(a): If $x = e^n$, then $\ln(e^n) = n \ln(e) = n$.

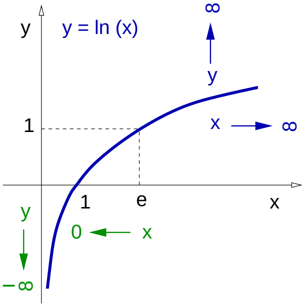
The graph of the natural logarithm

Remarks:

The graph of ln function has:

(a) A vertical asymptote at $x = 0$.

(b) No horizontal asymptote.



Proof: Recall $e = 2.718281... > 1$ and $\ln(e) = 1$.

(a): If $x = e^n$, then $\ln(e^n) = n\ln(e) = n$. Hence

$$\lim_{x\to\infty} \ln(x) = \infty.$$

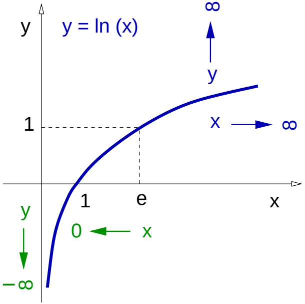
The graph of the natural logarithm

Remarks:

The graph of ln function has:

(a) A vertical asymptote at $x = 0$.

(b) No horizontal asymptote.



Proof: Recall $e = 2.718281... > 1$ and $\ln(e) = 1$.

(a): If $x = e^n$, then $\ln(e^n) = n\ln(e) = n$. Hence

$$\lim_{x\to\infty} \ln(x) = \infty.$$

(b): If $x = \dfrac{1}{e^n}$,

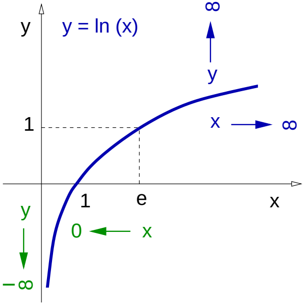
The graph of the natural logarithm

Remarks:

The graph of ln function has:

(a) A vertical asymptote at $x = 0$.

(b) No horizontal asymptote.



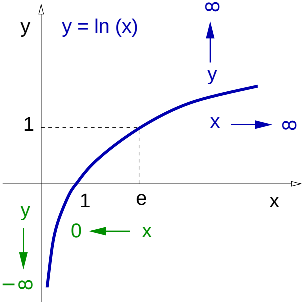
Proof: Recall $e = 2.718281... > 1$ and $\ln(e) = 1$.

(a): If $x = e^n$, then $\ln(e^n) = n\ln(e) = n$. Hence

$$\lim_{x\to\infty} \ln(x) = \infty.$$

(b): If $x = \frac{1}{e^n}$, then $\ln\left(\frac{1}{e^n}\right) = -\ln(e^n)$

The graph of the natural logarithm



Remarks:

The graph of ln function has:

(a) A vertical asymptote at $x = 0$.

(b) No horizontal asymptote.

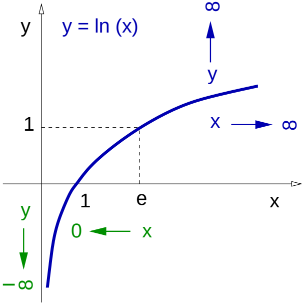
Proof: Recall $e = 2.718281... > 1$ and $\ln(e) = 1$.

(a): If $x = e^n$, then $\ln(e^n) = n \ln(e) = n$. Hence

$$\lim_{x \to \infty} \ln(x) = \infty.$$

(b): If $x = \dfrac{1}{e^n}$, then $\ln\left(\dfrac{1}{e^n}\right) = -\ln(e^n) - n \ln(e)$

The graph of the natural logarithm



Remarks:

The graph of ln function has:

(a) A vertical asymptote at $x = 0$.

(b) No horizontal asymptote.

Proof: Recall $e = 2.718281... > 1$ and $\ln(e) = 1$.

(a): If $x = e^n$, then $\ln(e^n) = n\ln(e) = n$. Hence

$$\lim_{x\to\infty} \ln(x) = \infty.$$

(b): If $x = \dfrac{1}{e^n}$, then $\ln\left(\dfrac{1}{e^n}\right) = -\ln(e^n) - n\ln(e) = -n.$

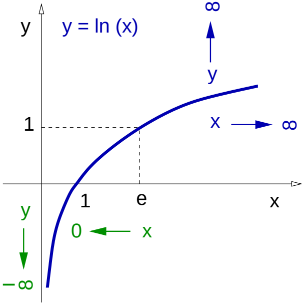
The graph of the natural logarithm

Remarks:

The graph of ln function has:

(a) A vertical asymptote at $x = 0$.

(b) No horizontal asymptote.



Proof: Recall $e = 2.718281... > 1$ and $\ln(e) = 1$.

(a): If $x = e^n$, then $\ln(e^n) = n\ln(e) = n$. Hence

$$\lim_{x\to\infty} \ln(x) = \infty.$$

(b): If $x = \frac{1}{e^n}$, then $\ln\left(\frac{1}{e^n}\right) = -\ln(e^n) - n\ln(e) = -n$. Hence

$$\lim_{x\to 0^+} \ln(x) = -\infty.$$

- Logarithmic differentiation.

Integrals involving logarithms.

Remark: It holds $\displaystyle\int \frac{dx}{x} = \ln(|x|) + c$ for $x \neq 0$ and $c \in \mathbb{R}$.

Integrals involving logarithms.

Remark: It holds $\displaystyle\int \frac{dx}{x} = \ln(|x|) + c$ for $x \neq 0$ and $c \in \mathbb{R}$.

Indeed, for $x > 0$ this is the definition of logarithm.

Integrals involving logarithms.

Remark: It holds $\displaystyle\int \frac{dx}{x} = \ln(|x|) + c$ for $x \neq 0$ and $c \in \mathbb{R}$.

Indeed, for $x > 0$ this is the definition of logarithm.

And for $x < 0$, we have that $-x > 0$,

Integrals involving logarithms.

Remark: It holds $\displaystyle\int \frac{dx}{x} = \ln(|x|) + c$ for $x \neq 0$ and $c \in \mathbb{R}$.

Indeed, for $x > 0$ this is the definition of logarithm.
And for $x < 0$, we have that $-x > 0$, then,

$$\int \frac{dx}{x} = \int \frac{(-dx)}{(-x)}$$

Integrals involving logarithms.

Remark: It holds $\displaystyle\int \frac{dx}{x} = \ln(|x|) + c$ for $x \neq 0$ and $c \in \mathbb{R}$.

Indeed, for $x > 0$ this is the definition of logarithm.
And for $x < 0$, we have that $-x > 0$, then,

$$\int \frac{dx}{x} = \int \frac{(-dx)}{(-x)} = \ln(-x) + c, \qquad -x > 0.$$

Integrals involving logarithms.

Remark: It holds $\displaystyle\int \frac{dx}{x} = \ln(|x|) + c$ for $x \neq 0$ and $c \in \mathbb{R}$.

Indeed, for $x > 0$ this is the definition of logarithm.
And for $x < 0$, we have that $-x > 0$, then,

$$\int \frac{dx}{x} = \int \frac{(-dx)}{(-x)} = \ln(-x) + c, \qquad -x > 0.$$

We conclude,

$$\int \frac{dx}{x} = \begin{cases} \ln(-x) + c & \text{if } x < 0, \\ \ln(x) + c & \text{if } x > 0. \end{cases}$$

Integrals involving logarithms.

Remark: It holds $\displaystyle\int \frac{dx}{x} = \ln(|x|) + c$ for $x \neq 0$ and $c \in \mathbb{R}$.

Indeed, for $x > 0$ this is the definition of logarithm.
And for $x < 0$, we have that $-x > 0$, then,

$$\int \frac{dx}{x} = \int \frac{(-dx)}{(-x)} = \ln(-x) + c, \qquad -x > 0.$$

We conclude,

$$\int \frac{dx}{x} = \begin{cases} \ln(-x) + c & \text{if } x < 0, \\ \ln(x) + c & \text{if } x > 0. \end{cases}$$

Remark: It also holds $\displaystyle\int \frac{f'(x)}{f(x)}\, dx = \ln(|f(x)|) + c$, for $f(x) \neq 0$.

Integrals involving logarithms.

Remarks:

(a) $\displaystyle\int \tan(x)\,dx = -\ln(|\cos(x)|) + c.$

Integrals involving logarithms.

Remarks:

(a) $\int \tan(x)\,dx = -\ln(|\cos(x)|) + c$. Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx$$

Integrals involving logarithms.

Remarks:

(a) $\displaystyle\int \tan(x)\,dx = -\ln(|\cos(x)|) + c$. Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx \quad u = \cos(x),$$

Integrals involving logarithms.

Remarks:

(a) $\displaystyle\int \tan(x)\,dx = -\ln(|\cos(x)|) + c$. Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx \quad u = \cos(x), \quad du = -\sin(x)\,dx.$$

Integrals involving logarithms.

Remarks:

(a) $\displaystyle\int \tan(x)\,dx = -\ln(|\cos(x)|) + c$. Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx \quad u = \cos(x), \quad du = -\sin(x)\,dx.$$

$$\int \tan(x)\,dx = -\int \frac{du}{u}$$

Integrals involving logarithms.

Remarks:

(a) $\displaystyle\int \tan(x)\,dx = -\ln(|\cos(x)|) + c$. Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx \quad u = \cos(x), \quad du = -\sin(x)\,dx.$$

$$\int \tan(x)\,dx = -\int \frac{du}{u} = -\ln(|u|) + c$$

Integrals involving logarithms.

Remarks:

(a) $\displaystyle\int \tan(x)\,dx = -\ln(|\cos(x)|) + c$. Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx \quad u = \cos(x), \quad du = -\sin(x)\,dx.$$

$$\int \tan(x)\,dx = -\int \frac{du}{u} = -\ln(|u|) + c = -\ln(|\cos(x)|) + c.$$

Integrals involving logarithms.

Remarks:

(a) $\displaystyle\int \tan(x)\,dx = -\ln(|\cos(x)|) + c$. Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx \quad u = \cos(x), \quad du = -\sin(x)\,dx.$$

$$\int \tan(x)\,dx = -\int \frac{du}{u} = -\ln(|u|) + c = -\ln(|\cos(x)|) + c.$$

(b) $\displaystyle\int \cot(x)\,dx = \ln(|\sin(x)|) + c$.

Integrals involving logarithms.

Remarks:

(a) $\int \tan(x)\,dx = -\ln(|\cos(x)|) + c$. Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx \quad u = \cos(x), \quad du = -\sin(x)\,dx.$$

$$\int \tan(x)\,dx = -\int \frac{du}{u} = -\ln(|u|) + c = -\ln(|\cos(x)|) + c.$$

(b) $\int \cot(x)\,dx = \ln(|\sin(x)|) + c$. Indeed,

$$\int \cot(x)\,dx = \int \frac{\cos(x)}{\sin(x)}\,dx$$

Integrals involving logarithms.

Remarks:

(a) $\displaystyle\int \tan(x)\,dx = -\ln(|\cos(x)|) + c.$ Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx \quad u = \cos(x), \quad du = -\sin(x)\,dx.$$

$$\int \tan(x)\,dx = -\int \frac{du}{u} = -\ln(|u|) + c = -\ln(|\cos(x)|) + c.$$

(b) $\displaystyle\int \cot(x)\,dx = \ln(|\sin(x)|) + c.$ Indeed,

$$\int \cot(x)\,dx = \int \frac{\cos(x)}{\sin(x)}\,dx \quad u = \sin(x),$$

Integrals involving logarithms.

Remarks:

(a) $\displaystyle\int \tan(x)\,dx = -\ln(|\cos(x)|) + c$. Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx \quad u = \cos(x), \quad du = -\sin(x)\,dx.$$

$$\int \tan(x)\,dx = -\int \frac{du}{u} = -\ln(|u|) + c = -\ln(|\cos(x)|) + c.$$

(b) $\displaystyle\int \cot(x)\,dx = \ln(|\sin(x)|) + c$. Indeed,

$$\int \cot(x)\,dx = \int \frac{\cos(x)}{\sin(x)}\,dx \quad u = \sin(x), \quad du = \cos(x)\,dx.$$

Integrals involving logarithms.

Remarks:

(a) $\int \tan(x)\,dx = -\ln(|\cos(x)|) + c$. Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx \quad u = \cos(x), \quad du = -\sin(x)\,dx.$$

$$\int \tan(x)\,dx = -\int \frac{du}{u} = -\ln(|u|) + c = -\ln(|\cos(x)|) + c.$$

(b) $\int \cot(x)\,dx = \ln(|\sin(x)|) + c$. Indeed,

$$\int \cot(x)\,dx = \int \frac{\cos(x)}{\sin(x)}\,dx \quad u = \sin(x), \quad du = \cos(x)\,dx.$$

$$\int \cot(x)\,dx = \int \frac{du}{u}$$

Integrals involving logarithms.

Remarks:

(a) $\displaystyle\int \tan(x)\,dx = -\ln(|\cos(x)|) + c$. Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx \qquad u = \cos(x), \qquad du = -\sin(x)\,dx.$$

$$\int \tan(x)\,dx = -\int \frac{du}{u} = -\ln(|u|) + c = -\ln(|\cos(x)|) + c.$$

(b) $\displaystyle\int \cot(x)\,dx = \ln(|\sin(x)|) + c$. Indeed,

$$\int \cot(x)\,dx = \int \frac{\cos(x)}{\sin(x)}\,dx \qquad u = \sin(x), \qquad du = \cos(x)\,dx.$$

$$\int \cot(x)\,dx = \int \frac{du}{u} = \ln(|u|) + c$$

Integrals involving logarithms.

Remarks:

(a) $\int \tan(x)\,dx = -\ln(|\cos(x)|) + c$. Indeed,

$$\int \tan(x)\,dx = \int \frac{\sin(x)}{\cos(x)}\,dx \quad u = \cos(x), \quad du = -\sin(x)\,dx.$$

$$\int \tan(x)\,dx = -\int \frac{du}{u} = -\ln(|u|) + c = -\ln(|\cos(x)|) + c.$$

(b) $\int \cot(x)\,dx = \ln(|\sin(x)|) + c$. Indeed,

$$\int \cot(x)\,dx = \int \frac{\cos(x)}{\sin(x)}\,dx \quad u = \sin(x), \quad du = \cos(x)\,dx.$$

$$\int \cot(x)\,dx = \int \frac{du}{u} = \ln(|u|) + c = \ln(|\sin(x)|) + c.$$

Integrals involving logarithms.

Example

Find $\;y(t) = \displaystyle\int \frac{3\sin(t)}{(2+\cos(t))}\,dt.$

Integrals involving logarithms.

Example

Find $y(t) = \displaystyle\int \frac{3\sin(t)}{(2+\cos(t))}\,dt.$

Solution:

$$y(t) = \int \frac{3\sin(t)}{(2+\cos(t))}\,dt,$$

Integrals involving logarithms.

Example

Find $y(t) = \int \frac{3\sin(t)}{(2+\cos(t))}\,dt.$

Solution:

$$y(t) = \int \frac{3\sin(t)}{(2+\cos(t))}\,dt, \qquad u = 2+\cos(t),$$

Integrals involving logarithms.

Example

Find $y(t) = \displaystyle\int \frac{3\sin(t)}{(2+\cos(t))}\,dt.$

Solution:

$$y(t) = \int \frac{3\sin(t)}{(2+\cos(t))}\,dt, \quad u = 2+\cos(t), \quad du = -\sin(t)\,dt.$$

Integrals involving logarithms.

Example

Find $y(t) = \int \frac{3\sin(t)}{(2+\cos(t))}\,dt.$

Solution:

$$y(t) = \int \frac{3\sin(t)}{(2+\cos(t))}\,dt, \quad u = 2+\cos(t), \quad du = -\sin(t)\,dt.$$

$$y(t) = \int \frac{3(-du)}{u}$$

Integrals involving logarithms.

Example

Find $y(t) = \displaystyle\int \frac{3\sin(t)}{(2+\cos(t))}\,dt.$

Solution:

$$y(t) = \int \frac{3\sin(t)}{(2+\cos(t))}\,dt, \quad u = 2+\cos(t), \quad du = -\sin(t)\,dt.$$

$$y(t) = \int \frac{3(-du)}{u} = -3\int \frac{du}{u}$$

Integrals involving logarithms.

Example

Find $\quad y(t) = \displaystyle\int \frac{3\sin(t)}{(2+\cos(t))}\,dt.$

Solution:

$$y(t) = \int \frac{3\sin(t)}{(2+\cos(t))}\,dt, \qquad u = 2+\cos(t), \qquad du = -\sin(t)\,dt.$$

$$y(t) = \int \frac{3(-du)}{u} = -3\int \frac{du}{u} = -3\,\ln(|u|) + c$$

Integrals involving logarithms.

Example

Find $y(t) = \displaystyle\int \frac{3\sin(t)}{(2+\cos(t))}\,dt.$

Solution:

$$y(t) = \int \frac{3\sin(t)}{(2+\cos(t))}\,dt, \quad u = 2+\cos(t), \quad du = -\sin(t)\,dt.$$

$$y(t) = \int \frac{3(-du)}{u} = -3\int \frac{du}{u} = -3\,\ln(|u|) + c$$

We conclude that $y(t) = -3\,\ln\big(|2+\cos(t)|\big) + c.$ $\triangleleft$

Natural Logarithms (Sect. 7.2)

- Definition as an integral.
- The derivative and properties.
- The graph of the natural logarithm.
- Integrals involving logarithms.
- **Logarithmic differentiation.**

Logarithmic differentiation

Remark: Logarithms can be used to simplify the derivative of complicated functions.

Logarithmic differentiation

Remark: Logarithms can be used to simplify the derivative of complicated functions.

Example

Find the derivative of $y(x) = \dfrac{x^3(x+2)^2}{\cos^3(x)}$.

Logarithmic differentiation

Remark: Logarithms can be used to simplify the derivative of complicated functions.

Example

Find the derivative of $y(x) = \dfrac{x^3(x+2)^2}{\cos^3(x)}$.

Solution: First compute $\ln[y(x)]$

Logarithmic differentiation

Remark: Logarithms can be used to simplify the derivative of complicated functions.

Example

Find the derivative of $y(x) = \dfrac{x^3(x+2)^2}{\cos^3(x)}$.

Solution: First compute $\ln[y(x)] = \ln\Big[\dfrac{x^3(x+2)^2}{\cos^3(x)}\Big]$,

Logarithmic differentiation

Remark: Logarithms can be used to simplify the derivative of complicated functions.

Example

Find the derivative of $y(x) = \dfrac{x^3(x+2)^2}{\cos^3(x)}$.

Solution: First compute $\ln[y(x)] = \ln\Big[\dfrac{x^3(x+2)^2}{\cos^3(x)}\Big]$,

$$\ln[y(x)] = \ln\big[x^3(x+2)^2\big] - \ln\big[\cos^3(x)\big],$$

Logarithmic differentiation

Remark: Logarithms can be used to simplify the derivative of complicated functions.

Example

Find the derivative of $y(x) = \dfrac{x^3(x+2)^2}{\cos^3(x)}$.

Solution: First compute $\ln[y(x)] = \ln\Big[\dfrac{x^3(x+2)^2}{\cos^3(x)}\Big]$,

$$\ln[y(x)] = \ln\big[x^3(x+2)^2\big] - \ln\big[\cos^3(x)\big],$$

$$\ln[y(x)] = \ln\big[x^3\big] + \ln\big[(x+2)^2\big] - \ln\big[\cos^3(x)\big],$$

Logarithmic differentiation

Remark: Logarithms can be used to simplify the derivative of complicated functions.

Example

Find the derivative of $y(x) = \dfrac{x^3(x+2)^2}{\cos^3(x)}$.

Solution: First compute $\ln[y(x)] = \ln\Big[\dfrac{x^3(x+2)^2}{\cos^3(x)}\Big]$,

$$\ln[y(x)] = \ln\big[x^3(x+2)^2\big] - \ln\big[\cos^3(x)\big],$$

$$\ln[y(x)] = \ln\big[x^3\big] + \ln\big[(x+2)^2\big] - \ln\big[\cos^3(x)\big],$$

$$\ln[y(x)] = 3\ln(x) + 2\ln(x+2) - 3\ln\big[\cos(x)\big].$$

Logarithmic differentiation

Example

Find the derivative of $y(x) = \dfrac{x^3 (x+2)^2}{\cos^3(x)}$.

Solution: Recall: $\ln[y(x)] = 3\ln(x) + 2\ln(x+2) - 3\ln\big[\cos(x)\big]$.

Logarithmic differentiation

Example

Find the derivative of $y(x) = \dfrac{x^3(x+2)^2}{\cos^3(x)}$.

Solution: Recall: $\ln[y(x)] = 3\ln(x) + 2\ln(x+2) - 3\ln\big[\cos(x)\big]$.

$$\frac{y'(x)}{y(x)} = \frac{3}{x} + \frac{2}{(x+2)} + \frac{3\sin(x)}{\cos(x)}.$$

Logarithmic differentiation

Example

Find the derivative of $y(x) = \dfrac{x^3(x+2)^2}{\cos^3(x)}$.

Solution: Recall: $\ln[y(x)] = 3\ln(x) + 2\ln(x+2) - 3\ln\big[\cos(x)\big]$.

$$\frac{y'(x)}{y(x)} = \frac{3}{x} + \frac{2}{(x+2)} + \frac{3\sin(x)}{\cos(x)}.$$

$$y'(x) = \left[\frac{3}{x} + \frac{2}{(x+2)} + \frac{3\sin(x)}{\cos(x)}\right] y(x).$$

Logarithmic differentiation

Example

Find the derivative of $y(x) = \dfrac{x^3(x+2)^2}{\cos^3(x)}$.

Solution: Recall: $\ln[y(x)] = 3\ln(x) + 2\ln(x+2) - 3\ln\big[\cos(x)\big]$.

$$\frac{y'(x)}{y(x)} = \frac{3}{x} + \frac{2}{(x+2)} + \frac{3\sin(x)}{\cos(x)}.$$

$$y'(x) = \left[\frac{3}{x} + \frac{2}{(x+2)} + \frac{3\sin(x)}{\cos(x)}\right] y(x).$$

We conclude that

$$y'(x) = \left[\frac{3}{x} + \frac{2}{(x+2)} + \frac{3\sin(x)}{\cos(x)}\right] \frac{\cos^3(x)}{x^3(x+2)^2}. \qquad \triangleleft$$

The inverse function (Sect. 7.1)

- One-to-one functions.
- The inverse function
- The graph of the inverse function.
- Derivatives of the inverse function.

One-to-one functions

Remark:

- Not every function is invertible.

One-to-one functions

Remark:

- Not every function is invertible.
- Only one-to-one functions are invertible.

One-to-one functions

Remark:

- Not every function is invertible.
- Only one-to-one functions are invertible.

Definition

A function $f : D \to \mathbb{R}$ is called *one-to-one* (injective) iff for every $x_1, x_2 \in D$ holds

$$x_1 \neq x_2 \quad \Rightarrow \quad f(x_1) \neq f(x_2).$$

One-to-one functions

Remark:

- Not every function is invertible.
- Only one-to-one functions are invertible.

Definition

A function $f : D \to \mathbb{R}$ is called *one-to-one* (injective) iff for every $x_1, x_2 \in D$ holds

$$x_1 \neq x_2 \quad \Rightarrow \quad f(x_1) \neq f(x_2).$$

Example

Invertible:

1. $y = x^3$, for $x \in \mathbb{R}$.

One-to-one functions

Remark:

- Not every function is invertible.
- Only one-to-one functions are invertible.

Definition

A function $f : D \to \mathbb{R}$ is called *one-to-one* (injective) iff for every $x_1, x_2 \in D$ holds

$$x_1 \neq x_2 \quad \Rightarrow \quad f(x_1) \neq f(x_2).$$

Example

Invertible:

1. $y = x^3$, for $x \in \mathbb{R}$.
2. $y = x^2$, for $x \in [0, b]$.

One-to-one functions

Remark:

- Not every function is invertible.
- Only one-to-one functions are invertible.

Definition

A function $f : D \to \mathbb{R}$ is called *one-to-one* (injective) iff for every $x_1, x_2 \in D$ holds

$$x_1 \neq x_2 \quad \Rightarrow \quad f(x_1) \neq f(x_2).$$

Example

Invertible:

1. $y = x^3$, for $x \in \mathbb{R}$.
2. $y = x^2$, for $x \in [0, b]$.
3. $y = \sqrt{x}$, for $x \in [0, \infty)$.

One-to-one functions

Remark:

- Not every function is invertible.
- Only one-to-one functions are invertible.

Definition

A function $f : D \to \mathbb{R}$ is called *one-to-one* (injective) iff for every $x_1, x_2 \in D$ holds

$$x_1 \neq x_2 \quad \Rightarrow \quad f(x_1) \neq f(x_2).$$

Example

Invertible:

1. $y = x^3$, for $x \in \mathbb{R}$.
2. $y = x^2$, for $x \in [0, b]$.
3. $y = \sqrt{x}$, for $x \in [0, \infty)$.
4. $y = \sin(x)$, $x \in [-\frac{\pi}{2}, \frac{\pi}{2}]$.

One-to-one functions

Remark:

- Not every function is invertible.
- Only one-to-one functions are invertible.

Definition

A function $f : D \to \mathbb{R}$ is called *one-to-one* (injective) iff for every $x_1, x_2 \in D$ holds

$$x_1 \neq x_2 \quad \Rightarrow \quad f(x_1) \neq f(x_2).$$

Example

Invertible:

1. $y = x^3$, for $x \in \mathbb{R}$.
2. $y = x^2$, for $x \in [0, b]$.
3. $y = \sqrt{x}$, for $x \in [0, \infty)$.
4. $y = \sin(x)$, $x \in [-\frac{\pi}{2}, \frac{\pi}{2}]$.

Not Invertible:

1. $y = x^2$, for $x \in [-a, a]$.

One-to-one functions

Remark:

- Not every function is invertible.
- Only one-to-one functions are invertible.

Definition

A function $f : D \to \mathbb{R}$ is called *one-to-one* (injective) iff for every $x_1, x_2 \in D$ holds

One-to-one functions

Remark:

- Not every function is invertible.
- Only one-to-one functions are invertible.

Definition

A function $f : D \to \mathbb{R}$ is called *one-to-one* (injective) iff for every $x_1, x_2 \in D$ holds

$$x_1 \neq x_2 \quad \Rightarrow \quad f(x_1) \neq f(x_2).$$

Example

Invertible:

1. $y = x^3$, for $x \in \mathbb{R}$.
2. $y = x^2$, for $x \in [0, b]$.
3. $y = \sqrt{x}$, for $x \in [0, \infty)$.
4. $y = \sin(x)$, $x \in [-\frac{\pi}{2}, \frac{\pi}{2}]$.

Not Invertible:

1. $y = x^2$, for $x \in [-a, a]$.
2. $y = |x|$, for $x \in [-a, a]$.
3. $y = \cos(x)$, $x \in [-a, a]$.
4. $y = \sin(x)$, for $x \in [0, \pi]$.

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2$$

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1$$

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2$$

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2 = f(x_2).$$

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2 = f(x_2).$$

(b) Recalling that $\cos(\theta) = \cos(-\theta)$,

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2 = f(x_2).$$

(b) Recalling that $\cos(\theta) = \cos(-\theta)$, and taking $x_1 = -\theta$, $x_2 = \theta$,

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2 = f(x_2).$$

(b) Recalling that $\cos(\theta) = \cos(-\theta)$, and taking $x_1 = -\theta$, $x_2 = \theta$,

$$f(-\theta) = \cos(-\theta)$$

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2 = f(x_2).$$

(b) Recalling that $\cos(\theta) = \cos(-\theta)$, and taking $x_1 = -\theta$, $x_2 = \theta$,

$$f(-\theta) = \cos(-\theta) = \cos(\theta)$$

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2 = f(x_2).$$

(b) Recalling that $\cos(\theta) = \cos(-\theta)$, and taking $x_1 = -\theta$, $x_2 = \theta$,

$$f(-\theta) = \cos(-\theta) = \cos(\theta) = f(\theta).$$

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2 = f(x_2).$$

(b) Recalling that $\cos(\theta) = \cos(-\theta)$, and taking $x_1 = -\theta$, $x_2 = \theta$,

$$f(-\theta) = \cos(-\theta) = \cos(\theta) = f(\theta).$$

(c) Since $\sin(\theta) = \sin(\pi - \theta)$,

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2 = f(x_2).$$

(b) Recalling that $\cos(\theta) = \cos(-\theta)$, and taking $x_1 = -\theta$, $x_2 = \theta$,

$$f(-\theta) = \cos(-\theta) = \cos(\theta) = f(\theta).$$

(c) Since $\sin(\theta) = \sin(\pi - \theta)$, and taking $x_1 = \pi/4$, $x_2 = 3\pi/4$,

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2 = f(x_2).$$

(b) Recalling that $\cos(\theta) = \cos(-\theta)$, and taking $x_1 = -\theta$, $x_2 = \theta$,

$$f(-\theta) = \cos(-\theta) = \cos(\theta) = f(\theta).$$

(c) Since $\sin(\theta) = \sin(\pi - \theta)$, and taking $x_1 = \pi/4$, $x_2 = 3\pi/4$,

$$f(\pi/4) = \sin(\pi/4)$$

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2 = f(x_2).$$

(b) Recalling that $\cos(\theta) = \cos(-\theta)$, and taking $x_1 = -\theta$, $x_2 = \theta$,

$$f(-\theta) = \cos(-\theta) = \cos(\theta) = f(\theta).$$

(c) Since $\sin(\theta) = \sin(\pi - \theta)$, and taking $x_1 = \pi/4$, $x_2 = 3\pi/4$,

$$f(\pi/4) = \sin(\pi/4) = \sin(\pi - \pi/4)$$

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2 = f(x_2).$$

(b) Recalling that $\cos(\theta) = \cos(-\theta)$, and taking $x_1 = -\theta$, $x_2 = \theta$,

$$f(-\theta) = \cos(-\theta) = \cos(\theta) = f(\theta).$$

(c) Since $\sin(\theta) = \sin(\pi - \theta)$, and taking $x_1 = \pi/4$, $x_2 = 3\pi/4$,

$$f(\pi/4) = \sin(\pi/4) = \sin(\pi - \pi/4) = \sin(3\pi/4)$$

One-to-one functions

Example

Verify that the functions below are not one-to-one:

(a) $y = x^2$, for $x \in [-a, a]$.

(b) $y = \cos(x)$, $x \in [-a, a]$.

(c) $y = \sin(x)$, for $x \in [0, \pi]$.

Solution:

(a) For $x_1 = -1$, $x_2 = 1$ we have that $x_1 \neq x_2$ and

$$f(x_1) = (-1)^2 = 1 = 1^2 = f(x_2).$$

(b) Recalling that $\cos(\theta) = \cos(-\theta)$, and taking $x_1 = -\theta$, $x_2 = \theta$,

$$f(-\theta) = \cos(-\theta) = \cos(\theta) = f(\theta).$$

(c) Since $\sin(\theta) = \sin(\pi - \theta)$, and taking $x_1 = \pi/4$, $x_2 = 3\pi/4$,

$$f(\pi/4) = \sin(\pi/4) = \sin(\pi - \pi/4) = \sin(3\pi/4) = f(3\pi/4). \quad \triangleleft$$

One-to-one functions

Remark: By looking at the graph of the function one can determine whether the function is one-to-one or not.

One-to-one functions

Remark: By looking at the graph of the function one can determine whether the function is one-to-one or not.

Theorem (Horizontal line test)

A function $f : D \to R$ is one-to-one iff the function graph intersects every horizontal line at most once.

One-to-one functions

Remark: By looking at the graph of the function one can determine whether the function is one-to-one or not.

Theorem (Horizontal line test)

A function $f : D \to R$ is one-to-one iff the function graph intersects every horizontal line at most once.

Proof: If a function f intersects the horizontal line $y = y_0$ at $(x_1, f(x_1))$ and $(x_2, f(x_2))$,

One-to-one functions

Remark: By looking at the graph of the function one can determine whether the function is one-to-one or not.

Theorem (Horizontal line test)

A function $f : D \to R$ is one-to-one iff the function graph intersects every horizontal line at most once.

Proof: If a function f intersects the horizontal line $y = y_0$ at $(x_1, f(x_1))$ and $(x_2, f(x_2))$, with $x_1 \neq x_2$,

One-to-one functions

Remark: By looking at the graph of the function one can determine whether the function is one-to-one or not.

Theorem (Horizontal line test)

A function $f : D \to R$ is one-to-one iff the function graph intersects every horizontal line at most once.

Proof: If a function f intersects the horizontal line $y = y_0$ at $(x_1, f(x_1))$ and $(x_2, f(x_2))$, with $x_1 \neq x_2$, that means $y_0 = f(x_1) = f(x_2)$.

One-to-one functions

Remark: By looking at the graph of the function one can determine whether the function is one-to-one or not.

Theorem (Horizontal line test)

A function $f : D \to R$ is one-to-one iff the function graph intersects every horizontal line at most once.

Proof: If a function f intersects the horizontal line $y = y_0$ at $(x_1, f(x_1))$ and $(x_2, f(x_2))$, with $x_1 \neq x_2$, that means $y_0 = f(x_1) = f(x_2)$. Hence f is not one-to-one. $\square$

The inverse function (Sect. 7.1)

- One-to-one functions.
- **The inverse function**
- The graph of the inverse function.
- Derivatives of the inverse function.

The inverse function

Remark: Only one-to-one functions are invertible.

The inverse function

Remark: Only one-to-one functions are invertible.

Definition

The *inverse* of a one-to-one function $f : D \to R$ is the function $f^{-1} : R \to D$ defined for all $x \in D$ and all $y \in R$ as follows

$$f^{-1}(y) = x \quad \Leftrightarrow \quad y = f(x).$$

The inverse function

Remark: Only one-to-one functions are invertible.

Definition

The *inverse* of a one-to-one function $f : D \to R$ is the function $f^{-1} : R \to D$ defined for all $x \in D$ and all $y \in R$ as follows

$$f^{-1}(y) = x \quad \Leftrightarrow \quad y = f(x).$$

Example

Find the inverse of $f(x) = 2x - 3$.

The inverse function

Remark: Only one-to-one functions are invertible.

Definition

The *inverse* of a one-to-one function $f : D \to R$ is the function $f^{-1} : R \to D$ defined for all $x \in D$ and all $y \in R$ as follows

$$f^{-1}(y) = x \quad \Leftrightarrow \quad y = f(x).$$

Example

Find the inverse of $f(x) = 2x - 3$.

Solution: Denote $y = f(x)$,

The inverse function

Remark: Only one-to-one functions are invertible.

Definition

The *inverse* of a one-to-one function $f : D \to R$ is the function $f^{-1} : R \to D$ defined for all $x \in D$ and all $y \in R$ as follows

$$f^{-1}(y) = x \quad \Leftrightarrow \quad y = f(x).$$

Example

Find the inverse of $f(x) = 2x - 3$.

Solution: Denote $y = f(x)$, that is, $y = 2x - 3$.

The inverse function

Definition

The *inverse* of a one-to-one function $f : D \to R$ is the function $f^{-1} : R \to D$ defined for all $x \in D$ and all $y \in R$ as follows

$$f^{-1}(y) = x \quad \Leftrightarrow \quad y = f(x).$$

Example

Find the inverse of $f(x) = 2x - 3$.

Solution: Denote $y = f(x)$, that is, $y = 2x - 3$. Find x in the expression above,

The inverse function

Remark: Only one-to-one functions are invertible.

Definition

The *inverse* of a one-to-one function $f : D \to R$ is the function $f^{-1} : R \to D$ defined for all $x \in D$ and all $y \in R$ as follows

$$f^{-1}(y) = x \quad \Leftrightarrow \quad y = f(x).$$

Example

Find the inverse of $f(x) = 2x - 3$.

Solution: Denote $y = f(x)$, that is, $y = 2x - 3$. Find x in the expression above,

$$2x = y + 3$$

The inverse function

Remark: Only one-to-one functions are invertible.

Definition

The *inverse* of a one-to-one function $f : D \to R$ is the function $f^{-1} : R \to D$ defined for all $x \in D$ and all $y \in R$ as follows

$$f^{-1}(y) = x \quad \Leftrightarrow \quad y = f(x).$$

Example

Find the inverse of $f(x) = 2x - 3$.

Solution: Denote $y = f(x)$, that is, $y = 2x - 3$. Find x in the expression above,

$$2x = y + 3 \quad \Rightarrow \quad x = \frac{1}{2}\,y + \frac{3}{2}.$$

The inverse function

Remark: Only one-to-one functions are invertible.

Definition

The *inverse* of a one-to-one function $f : D \to R$ is the function $f^{-1} : R \to D$ defined for all $x \in D$ and all $y \in R$ as follows

$$f^{-1}(y) = x \quad \Leftrightarrow \quad y = f(x).$$

Example

Find the inverse of $f(x) = 2x - 3$.

Solution: Denote $y = f(x)$, that is, $y = 2x - 3$. Find x in the expression above,

$$2x = y + 3 \quad \Rightarrow \quad x = \frac{1}{2}\,y + \frac{3}{2}.$$

Then, the inverse function is $f^{-1}(y) = \frac{1}{2}\,y + \frac{3}{2}$. $\triangleleft$

The inverse function

Remark:

- If f^{-1} is the inverse of f, then holds

$$(f^{-1} \circ f)(x) = x, \quad (f \circ f^{-1})(y) = y.$$

The inverse function

Remark:

- If f^{-1} is the inverse of f, then holds
$$(f^{-1} \circ f)(x) = x, \quad (f \circ f^{-1})(y) = y.$$
- Equivalently,
$$f^{-1}\big(f(x)\big) = x, \quad f\big(f^{-1}(y)\big) = y.$$

The inverse function

Remark:

- If f^{-1} is the inverse of f, then holds

$$(f^{-1} \circ f)(x) = x, \quad (f \circ f^{-1})(y) = y.$$

- Equivalently,

$$f^{-1}\big(f(x)\big) = x, \quad f\big(f^{-1}(y)\big) = y.$$

Example

Verify the relations above for $f(x) = 2x - 3$.

The inverse function

Remark:

- If f^{-1} is the inverse of f, then holds

$$(f^{-1} \circ f)(x) = x, \quad (f \circ f^{-1})(y) = y.$$

- Equivalently,

$$f^{-1}\big(f(x)\big) = x, \quad f\big(f^{-1}(y)\big) = y.$$

Example

Verify the relations above for $f(x) = 2x - 3$.

Solution: Recall: $f^{-1}(y) = (y+3)/2$.

The inverse function

Remark:

- If f^{-1} is the inverse of f, then holds

$$(f^{-1} \circ f)(x) = x, \quad (f \circ f^{-1})(y) = y.$$

- Equivalently,

$$f^{-1}\big(f(x)\big) = x, \quad f\big(f^{-1}(y)\big) = y.$$

Example

Verify the relations above for $f(x) = 2x - 3$.

Solution: Recall: $f^{-1}(y) = (y + 3)/2$. Hence

$$f^{-1}(f(x))$$

The inverse function

Remark:

- If f^{-1} is the inverse of f, then holds

$$(f^{-1} \circ f)(x) = x, \quad (f \circ f^{-1})(y) = y.$$

- Equivalently,

$$f^{-1}\big(f(x)\big) = x, \quad f\big(f^{-1}(y)\big) = y.$$

Example

Verify the relations above for $f(x) = 2x - 3$.

Solution: Recall: $f^{-1}(y) = (y + 3)/2$. Hence

$$f^{-1}(f(x)) = f^{-1}(2x - 3)$$

The inverse function

Remark:

- If f^{-1} is the inverse of f, then holds
$$(f^{-1} \circ f)(x) = x, \quad (f \circ f^{-1})(y) = y.$$
- Equivalently,
$$f^{-1}\big(f(x)\big) = x, \quad f\big(f^{-1}(y)\big) = y.$$

Example

Verify the relations above for $f(x) = 2x - 3$.

Solution: Recall: $f^{-1}(y) = (y+3)/2$. Hence

$$f^{-1}(f(x)) = f^{-1}(2x-3) = \frac{1}{2}\big[(2x-3)+3\big]$$

The inverse function

Remark:

- If f^{-1} is the inverse of f, then holds

$$(f^{-1} \circ f)(x) = x, \quad (f \circ f^{-1})(y) = y.$$

- Equivalently,

Derivatives of the inverse function.

Theorem (Derivative for inverse functions)

If the invertible function $f : D \to R$ is differentiable and $f'(x) \neq 0$ for every $x \in D$, then the function $f^{-1} : R \to D$ is differentiable. Furthermore, for every $y \in R$ holds

$$\left(f^{-1}\right)'(y) = \frac{1}{f'\big(f^{-1}(y)\big)}.$$

Example

Verify the Theorem above for $f(x) = 2x - 3$.

Solution: This case is simple because $f'(x) = 2$, constant.

Derivatives of the inverse function.

Theorem (Derivative for inverse functions)

If the invertible function $f : D \to R$ is differentiable and $f'(x) \neq 0$ for every $x \in D$, then the function $f^{-1} : R \to D$ is differentiable. Furthermore, for every $y \in R$ holds

$$\left(f^{-1}\right)'(y) = \frac{1}{f'\left(f^{-1}(y)\right)}.$$

Example

Verify the Theorem above for $f(x) = 2x - 3$.

Solution: This case is simple because $f'(x) = 2$, constant.

Since $f^{-1}(y) = \dfrac{1}{2}\,(y + 3)$,

Derivatives of the inverse function.

Theorem (Derivative for inverse functions)

If the invertible function $f : D \to R$ is differentiable and $f'(x) \neq 0$ for every $x \in D$, then the function $f^{-1} : R \to D$ is differentiable. Furthermore, for every $y \in R$ holds

$$\left(f^{-1}\right)'(y) = \frac{1}{f'\big(f^{-1}(y)\big)}.$$

Example

Verify the Theorem above for $f(x) = 2x - 3$.

Solution: This case is simple because $f'(x) = 2$, constant.

Since $f^{-1}(y) = \frac{1}{2}(y + 3)$, then $\left(f^{-1}\right)'(y) = \frac{1}{2}$, constant.

Derivatives of the inverse function.

Theorem (Derivative for inverse functions)

If the invertible function $f : D \to R$ is differentiable and $f'(x) \neq 0$ for every $x \in D$, then the function $f^{-1} : R \to D$ is differentiable. Furthermore, for every $y \in R$ holds

$$\left(f^{-1}\right)'(y) = \frac{1}{f'\left(f^{-1}(y)\right)}.$$

Example

Verify the Theorem above for $f(x) = 2x - 3$.

Solution: This case is simple because $f'(x) = 2$, constant.

Since $f^{-1}(y) = \frac{1}{2}(y + 3)$, then $\left(f^{-1}\right)'(y) = \frac{1}{2}$, constant.

Therefore, $\left(f^{-1}\right)' = \frac{1}{f'}$. $\triangleleft$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function.

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$,

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$, then

$$y = x^3$$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$, then

$$y = x^3 \quad \Rightarrow \quad x = y^{1/3}$$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$, then

$$y = x^3 \quad \Rightarrow \quad x = y^{1/3} \quad \Rightarrow \quad f^{-1}(y) = y^{1/3}.$$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$, then

$$y = x^3 \quad \Rightarrow \quad x = y^{1/3} \quad \Rightarrow \quad f^{-1}(y) = y^{1/3}.$$

Compute now the derivative of the inverse function,

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$, then

$$y = x^3 \quad \Rightarrow \quad x = y^{1/3} \quad \Rightarrow \quad f^{-1}(y) = y^{1/3}.$$

Compute now the derivative of the inverse function,

$$\big(f^{-1}\big)'(y) = \frac{1}{3}\, y^{-2/3}$$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$, then

$$y = x^3 \quad \Rightarrow \quad x = y^{1/3} \quad \Rightarrow \quad f^{-1}(y) = y^{1/3}.$$

Compute now the derivative of the inverse function,

$$\big(f^{-1}\big)'(y) = \frac{1}{3}\, y^{-2/3} = \frac{1}{3}\, \frac{1}{y^{2/3}}.$$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$, then

$$y = x^3 \quad \Rightarrow \quad x = y^{1/3} \quad \Rightarrow \quad f^{-1}(y) = y^{1/3}.$$

Compute now the derivative of the inverse function,

$$\left(f^{-1}\right)'(y) = \frac{1}{3}\, y^{-2/3} = \frac{1}{3}\,\frac{1}{y^{2/3}}.$$

Compute now the derivative of the original function,

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$, then

$$y = x^3 \quad \Rightarrow \quad x = y^{1/3} \quad \Rightarrow \quad f^{-1}(y) = y^{1/3}.$$

Compute now the derivative of the inverse function,

$$\big(f^{-1}\big)'(y) = \frac{1}{3}\, y^{-2/3} = \frac{1}{3}\, \frac{1}{y^{2/3}}.$$

Compute now the derivative of the original function,

$$f'(x) = 3\, x^2$$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$, then

$$y = x^3 \quad \Rightarrow \quad x = y^{1/3} \quad \Rightarrow \quad f^{-1}(y) = y^{1/3}.$$

Compute now the derivative of the inverse function,

$$\left(f^{-1}\right)'(y) = \frac{1}{3}\, y^{-2/3} = \frac{1}{3}\, \frac{1}{y^{2/3}}.$$

Compute now the derivative of the original function,

$$f'(x) = 3\,x^2 \quad \Rightarrow \quad f'\big(f^{-1}(y)\big) = 3\big(f^{-1}(y)\big)^2$$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$, then

$$y = x^3 \quad \Rightarrow \quad x = y^{1/3} \quad \Rightarrow \quad f^{-1}(y) = y^{1/3}.$$

Compute now the derivative of the inverse function,

$$\big(f^{-1}\big)'(y) = \frac{1}{3}\, y^{-2/3} = \frac{1}{3}\, \frac{1}{y^{2/3}}.$$

Compute now the derivative of the original function,

$$f'(x) = 3\,x^2 \quad \Rightarrow \quad f'\big(f^{-1}(y)\big) = 3\big(f^{-1}(y)\big)^2 = 3\big(y^{1/3}\big)^2.$$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$, then

$$y = x^3 \quad \Rightarrow \quad x = y^{1/3} \quad \Rightarrow \quad f^{-1}(y) = y^{1/3}.$$

Compute now the derivative of the inverse function,

$$\left(f^{-1}\right)'(y) = \frac{1}{3}\, y^{-2/3} = \frac{1}{3}\, \frac{1}{y^{2/3}}.$$

Compute now the derivative of the original function,

$$f'(x) = 3\,x^2 \quad \Rightarrow \quad f'\big(f^{-1}(y)\big) = 3\big(f^{-1}(y)\big)^2 = 3\big(y^{1/3}\big)^2.$$

We conclude that $\dfrac{1}{3\,y^{2/3}} = \left(f^{-1}\right)'(y)$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3$.

Solution:

We first compute the inverse function. Denote $y = f(x)$, then

$$y = x^3 \quad \Rightarrow \quad x = y^{1/3} \quad \Rightarrow \quad f^{-1}(y) = y^{1/3}.$$

Compute now the derivative of the inverse function,

$$\left(f^{-1}\right)'(y) = \frac{1}{3}\, y^{-2/3} = \frac{1}{3}\, \frac{1}{y^{2/3}}.$$

Compute now the derivative of the original function,

$$f'(x) = 3\,x^2 \quad \Rightarrow \quad f'\big(f^{-1}(y)\big) = 3\big(f^{-1}(y)\big)^2 = 3\big(y^{1/3}\big)^2.$$

We conclude that $\dfrac{1}{3\,y^{2/3}} = \left(f^{-1}\right)'(y) = \dfrac{1}{f'\big(f^{-1}(y)\big)}$. $\lhd$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3 + x - 1$ at $x = 2$.

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3 + x - 1$ at $x = 2$.

Solution: In this case is difficult to find $f^{-1}(y)$ for $y \in \mathbb{R}$.

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3 + x - 1$ at $x = 2$.

Solution: In this case is difficult to find $f^{-1}(y)$ for $y \in \mathbb{R}$.

But at $x = 2$ we have $f(2) = 2^3 + 2 - 1$,

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3 + x - 1$ at $x = 2$.

Solution: In this case is difficult to find $f^{-1}(y)$ for $y \in \mathbb{R}$.

But at $x = 2$ we have $f(2) = 2^3 + 2 - 1$, that is, $f(2) = 9$.

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3 + x - 1$ at $x = 2$.

Solution: In this case is difficult to find $f^{-1}(y)$ for $y \in \mathbb{R}$.

But at $x = 2$ we have $f(2) = 2^3 + 2 - 1$, that is, $f(2) = 9$.

Therefore $f^{-1}(9) = 2$.

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3 + x - 1$ at $x = 2$.

Solution: In this case is difficult to find $f^{-1}(y)$ for $y \in \mathbb{R}$.

But at $x = 2$ we have $f(2) = 2^3 + 2 - 1$, that is, $f(2) = 9$.

Therefore $f^{-1}(9) = 2$.

Compute now the derivative of the original function,

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3 + x - 1$ at $x = 2$.

Solution: In this case is difficult to find $f^{-1}(y)$ for $y \in \mathbb{R}$.

But at $x = 2$ we have $f(2) = 2^3 + 2 - 1$, that is, $f(2) = 9$.

Therefore $f^{-1}(9) = 2$.

Compute now the derivative of the original function,

$$f'(x) = 3\,x^2 + 1.$$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3 + x - 1$ at $x = 2$.

Solution: In this case is difficult to find $f^{-1}(y)$ for $y \in \mathbb{R}$.

But at $x = 2$ we have $f(2) = 2^3 + 2 - 1$, that is, $f(2) = 9$.

Therefore $f^{-1}(9) = 2$.

Compute now the derivative of the original function,

$$f'(x) = 3\,x^2 + 1.$$

Then the formula in the Theorem, $\big(f^{-1}\big)'(y) = \dfrac{1}{f'\big(f^{-1}(y)\big)}$,

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3 + x - 1$ at $x = 2$.

Solution: In this case is difficult to find $f^{-1}(y)$ for $y \in \mathbb{R}$.

But at $x = 2$ we have $f(2) = 2^3 + 2 - 1$, that is, $f(2) = 9$.

Therefore $f^{-1}(9) = 2$.

Compute now the derivative of the original function,

$$f'(x) = 3\,x^2 + 1.$$

Then the formula in the Theorem, $\big(f^{-1}\big)'(y) = \dfrac{1}{f'\big(f^{-1}(y)\big)}$,

for $y = 9$ implies

$$\big(f^{-1}\big)'(9) = \frac{1}{f'\big(f^{-1}(9)\big)}$$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3 + x - 1$ at $x = 2$.

Solution: In this case is difficult to find $f^{-1}(y)$ for $y \in \mathbb{R}$.

But at $x = 2$ we have $f(2) = 2^3 + 2 - 1$, that is, $f(2) = 9$.

Therefore $f^{-1}(9) = 2$.

Compute now the derivative of the original function,

$$f'(x) = 3\,x^2 + 1.$$

Then the formula in the Theorem, $\big(f^{-1}\big)'(y) = \dfrac{1}{f'\big(f^{-1}(y)\big)}$,

for $y = 9$ implies

$$\big(f^{-1}\big)'(9) = \frac{1}{f'\big(f^{-1}(9)\big)} = \frac{1}{f'(2)}$$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3 + x - 1$ at $x = 2$.

Solution: In this case is difficult to find $f^{-1}(y)$ for $y \in \mathbb{R}$.
But at $x = 2$ we have $f(2) = 2^3 + 2 - 1$, that is, $f(2) = 9$.
Therefore $f^{-1}(9) = 2$.
Compute now the derivative of the original function,

$$f'(x) = 3\,x^2 + 1.$$

Then the formula in the Theorem, $\big(f^{-1}\big)'(y) = \dfrac{1}{f'\big(f^{-1}(y)\big)}$,
for $y = 9$ implies

$$\big(f^{-1}\big)'(9) = \frac{1}{f'\big(f^{-1}(9)\big)} = \frac{1}{f'(2)} = \frac{1}{3\,(4) + 1}.$$

Derivatives of the inverse function.

Example

Verify the Theorem above for $f(x) = x^3 + x - 1$ at $x = 2$.

Solution: In this case is difficult to find $f^{-1}(y)$ for $y \in \mathbb{R}$.
But at $x = 2$ we have $f(2) = 2^3 + 2 - 1$, that is, $f(2) = 9$.
Therefore $f^{-1}(9) = 2$.
Compute now the derivative of the original function,

$$f'(x) = 3\,x^2 + 1.$$

Then the formula in the Theorem, $\big(f^{-1}\big)'(y) = \dfrac{1}{f'\big(f^{-1}(y)\big)}$,
for $y = 9$ implies

$$\big(f^{-1}\big)'(9) = \frac{1}{f'\big(f^{-1}(9)\big)} = \frac{1}{f'(2)} = \frac{1}{3\,(4) + 1}.$$

We conclude that $\big(f^{-1}\big)'(y) = \dfrac{1}{13}$. $\triangleleft$
